# OPIOID USE DISORDER (OUD)

### WHAT IS AN OPIOID

Opioids bind to specific receptors in the brain that reduce the transmission of pain signals throughout the body and are recruited in response to rewarding stimuli. Opioids include: heroin, fentanyl, and prescription pain meds.

### **OPIOIDS & OVERDOSE**

**28** people died from a opioid overdose in Lewis County in 2022 (DOH 2022).

**70%** of drug overdose deaths among Lewis County residents involved an opioid in 2022 (DOH 2022).

People without health insurance, or who were incarcerated, or who are living in poverty are at increased risk of fatal opioid overdose (MDAC Study 2020).

Between 2012-2022 Lewis

County had the 9th

prescribing rate in

Washington State (95.3)

prescriptions per 1,000

people) (DOH 2012-2022).

highest opioid

### TEENS AND OPIOIDS

support.

Most teens do not misuse opioids.

**98.2%** of Lewis County 10th graders and **97.3%** of 8th graders

report NOT using pain killers to aet hiah. (HYS Survey 2023)

94% of Centralia High School parents say it is "wrong" or "very wrong" for their child to misuse prescription medications.

(Centralia Community Survey 2023)

- Fentanyl is a very strong, fast-acting opioid. It is 80-100 times stronger than morphine.
- Fentanyl comes in many forms, including pill, powder, and rock.
- A fentanyl overdose can be reversed using Naloxone (aka Narcan)

## WHAT ARE SYMPTOMS OF AN OUD?

The brain's reward system can be quickly disrupted by misusing

prescription pain medications or using other opioids such as heroin. This

can lead to opioid use disorder. The good news is that the brain's reward

system can be restored with treatment, including medication and strong

The formal diagnosis of OUD involves these behaviors of individuals:

- Keeps using opioids even though they know it is hurting them,
- Can't quit even when they try repeatedly,
- Spends lots of time using opioids, or recovering from using,

WHAT IS OPIOID USE DISORDER?

Uses opioids in dangerous situations

#### **HOW IS OUD TREATED?**

- Interventions for OUD include ongoing substance use disorder treatment with medications such as methadone, buprenorphine, or naltrexone.
- In addition to medications, many people will also benefit from professional support services including counseling, drug screening and medical monitoring.

## **CAN I OVERDOSE FROM TOUCHING IT?**

- No, you can't overdose on fentanyl by touching it. There have been no confirmed cases of overdose among bystanders or professional first responders who responded to a fentanyl overdose. Fentanyl is unlikely to become aerosolized and cause overdose.
- Avoid touching fentanyl if you have open
- If you do touch fentanyl, avoid touching your face, especially the eyes, nose, or mouth.

## HOW CAN I HELP PREVENT OVERDOSE & OPIOID ADDICTION?

- Lead with empathy; Set aside fear, confusion, frustration, or anger toward a person who is experiencing substance use disorder. Empathy can encourage people to carry naloxone, seek resources for support, and connect with loved ones and peers to aid in their recovery.
- Talk with your kids about substance use and communicate your desire for them not to use drugs even if you don't think they would use drugs.
- Lock up your medications and safely dispose of unneeded or expired medications. Most opioid misuse starts with people using medication that wasn't prescribed for them — usually taken from a friend or family member. Find a safe disposal location at medtakebackwashington.org/.
